

# CONTENTS

The Official Review Journal of the American College of Sports Medicine

VOLUME 37 | NUMBER 2 | APRIL 2009

## Commentary to Accompany

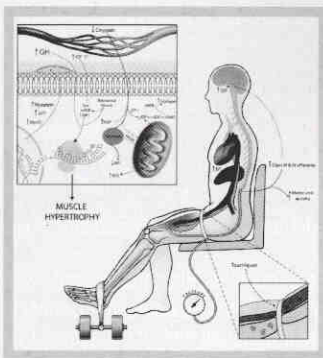

- 57 Nitric Oxide and the Stress Response — Two 2-Edged Swords Swung Together  
**Pope L. Moseley**
- 58 Beyond the Bout — New Perspectives on Exercise and Fat Oxidation  
**Steven R. Smith**

page 60

## Articles

- 60 Potential Benefits of Warm-up for Neuromuscular Performance of Older Athletes  
**Anthony A. Vandervoort**  
*A proper warm-up routine assists the older athlete to execute forceful, rapid movements through a full range of motion.*
- 66 Plasticity of the Human Tendon to Short- and Long-Term Mechanical Loading  
**Adamantios Arampatzis, Kiros Karamanidis, Lida Mademli, and Kristen Albracht**  
*Short term loading did not alter the mechanical properties of tendons. Tendons mechanical and morphological properties adapt to chronic loading.*
- 73 Exercise Regulates Heat Shock Proteins and Nitric Oxide  
**Michelle S. Harkins**  
*Exercise regulates Heat Shock Protein and Nitric Oxide interactions and protects against organ dysfunction and oxidative stresses.*
- 78 Blood Flow Restricted Exercise and Skeletal Muscle Health  
**Todd M. Manini and Brian C. Clark**  
*Exercise with blood flow restriction results in muscle growth, and this review discusses its efficacy, mechanisms of action, and feasibility.*
- 86 Basal and Exercise-Induced Regulation of Skeletal Muscle Capillarization  
**Timothy P. Gavin**  
*The regulation of basal and exercise-induced skeletal muscle capillarization involves the coordinated integration of several signaling pathways, growth factors, and cell types.*
- 93 Exercise Improves Fat Metabolism in Muscle But Does Not Increase 24-h Fat Oxidation  
**Edward L. Melanson, Paul S. MacLean, and James O. Hill**  
*Exercise increases the capacity of muscle to oxidize fat, but moderate duration exercise ( $\leq 1$  h) does not impact 24-h fat oxidation or fat balance.*
- 102 The Quadrupedal Nature of Human Bipedal Locomotion  
**E. Paul Zehr, Sandra R. Hundza, and Erin V. Vasudevan**  
*Neuronal interactions between arm and leg activity during rhythmic human movement assist in coordinating locomotion and may be usefully exploited in rehabilitation of walking.*

page 78

## Letters to the Editor-in-Chief

- 109 How Should Objectively Measured Physical Activity Data Be Used Analytically?  
**Yukitoshi Aoyagi and Roy J. Shephard**
- 110 Response  
**Russell R. Pate, Jennifer O'Neill, and Felipe Lobelo**
